

ARM Architecture Overview

THE ARCHITECTURE FOR THE DIGITAL WORLD!

ARM

Development of the ARM Architecture

Processor Architecture = Instruction Set + Programmer's model

ARM7TDMI ARM922T

Thumb instruction set

ARM926EJ-S ARM946E-S ARM966E-S

Improved ARM/Thumb Interworking

DSP instructions

Extensions:

Jazelle (5TEJ)

ARM1136JF-S ARM1176JZF-S ARM11 MPCore

SIMD Instructions
Unaligned data support

Extensions:

Thumb-2 (6T2)
TrustZone (6Z)

Multicore (6K)

Cortex-A8/R4/M3/M1

Thumb-2

Extensions:

v7A (applications) - NEON

v7R (real time) - HW Divide

V7M (microcontroller) – HW Divide and Thumb-2 only

- Note: Implementations of the same architecture can be very different
 - ARM7TDMI architecture v4T. Von Neuman core with 3 stage pipeline
 - ARM920T architecture v4T. Harvard core with 5 stage pipeline and MMU

ARM Architecture profiles

- Application profile (ARMv7-A → e.g. Cortex-A8)
 - Memory management support (MMU)
 - Highest performance at low power
 - Influenced by multi-tasking OS system requirements
 - TrustZone and Jazelle-RCT for a safe, extensible system
- Real-time profile (ARMv7-R → e.g. Cortex-R4)
 - Protected memory (MPU)
 - Low latency and predictability 'real-time' needs
 - Evolutionary path for traditional embedded business
- Microcontroller profile (ARMv7-M → e.g. Cortex-M3)
 - Lowest gate count entry point
 - Deterministic and predictable behavior a key priority
 - Deeply embedded use

THE ARCHITECTURE FOR THE DIGITAL WORLD

ARM

Programmer's Model

Data Sizes and Instruction Sets

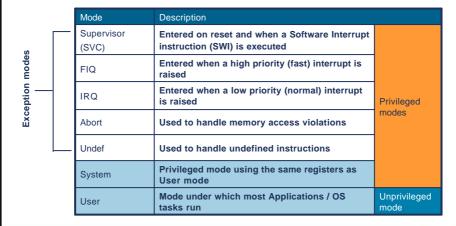

- When used in relation to the ARM:
 - Halfword means 16 bits (two bytes)
 - Word means 32 bits (four bytes)
 - Doubleword means 64 bits (eight bytes)
- Most ARMs implement two instruction sets
 - 32-bit ARM Instruction Set
 - 16-bit Thumb Instruction Set
- Latest ARM cores introduce a new instruction set Thumb-2
 - Provides a mixture of 32-bit and 16-bit instructions
 - Maintains code density with increased flexibility
- Jazelle-DBX cores can also execute Java bytecode

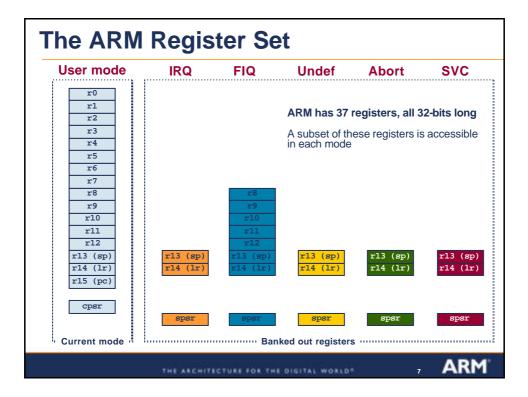

HE ARCHITECTURE FOR THE DIGITAL WORLD!

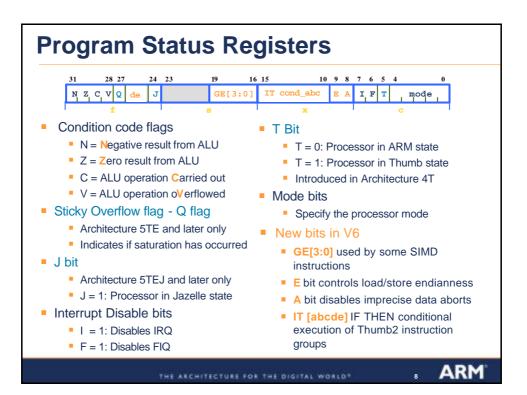

ARM

Processor Modes

- The ARM has seven basic operating modes:
 - Each mode has access to own stack and a different subset of registers
 - Some operations can only be carried out in a privileged mode

Data alignment

- Prior to architecture v6 data accesses must be appropriately aligned for access size
 - Unaligned addresses will produce unexpected/undefined results

 Unaligned data can be accessed using multiple aligned accesses combined with shift/mask operations

HE ARCHITECTURE FOR THE DIGITAL WORLD

ARM

Exception Handling

- When an exception occurs, the core:
 - Copies CPSR into SPSR <mode>
 - Sets appropriate CPSR bits
 - Change to ARM state
 - Change to exception mode
 - Disable interrupts (if appropriate)
 - Stores the return address in LR <mode>
 - Sets PC to vector address
- To return, exception handler needs to:
 - Restore CPSR from SPSR_<mode>
 - Restore PC from LR <mode>

FIQ 0x1C **IRQ** 0x18 (Reserved) 0x14 **Data Abort** 0x10 **Prefetch Abort** 0x0C 80x0 Software Interrupt Undefined Instruction 0x04 Reset 0x00

Vector Table

Vector table can also be at 0xFFFF0000 on most cores

- Must be done in ARM state in most cores, but...
 - ... Thumb-2 capable cores can do this in Thumb state

Introduction to Instruction Sets

ARM

ARM Instruction Set

- All instructions are 32 bits long / many execute in a single cycle
- Instructions are conditionally executed
- A load / store architecture
 - Example data processing instructions

Example branching instructionB <Label>

Example memory access instructions

```
LDR r0,[r1]

STRNEB r2,[r3,r4]

STMFD sp!,{r4-r8,lr}
```

```
r0 = r1 - 5
r2 = r3 + (r3 * 4)
IF EQ condition true r5 = r5 + r6
```

Branch forwards or backwards relative to current PC (+/- 32MB range)

Load word at address r1 into r0

IF NE condition true, store bottom byte of r2 to address r3+r4

Store registers r4 to r8 and 1r on stack. Then update stack pointer

Thumb Instruction Set

- Thumb is a 16-bit instruction set
 - Optimized for code density from C code (~65% of ARM code size)
 - Improved performance from narrow memory
 - Subset of the functionality of the ARM instruction set
- Thumb is not a "regular" instruction set!
 - Constraints are not generally consistent
 - Targeted at compiler generation, not hand coding

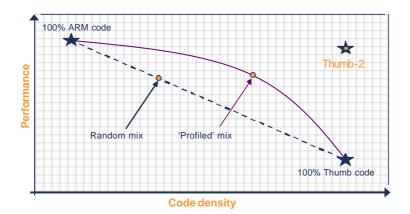

HE ARCHITECTURE FOR THE DIGITAL WORLD!

ARM

Thumb-2 Instruction Set

- Thumb-2 is a major extension to the Thumb ISA
 - Adds 32-bit instructions to implement almost all of the ARM ISA functionality
 - Retains the complete 16-bit Thumb instruction set
- Design objective: ARM performance with Thumb code density
 - No switching between ARM-Thumb states
 - Compiler automatically selects mix of 16 and 32 bit instructions

Thumb 2 Performance / Density

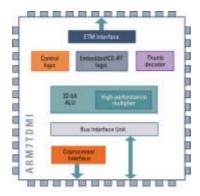

HE ARCHITECTURE FOR THE DIGITAL WORLD

ARM

Processor Cores

ARM7TDMI Processor

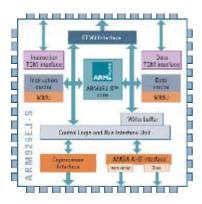

- Architecture v4T
- 3-stage pipeline
- Single interface to memory

HE ARCHITECTURE FOR THE DIGITAL WORLD

ARM

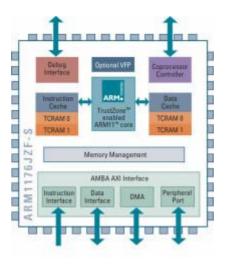

ARM926EJ-S Processor

ARM926EJ-S

- Architecture v5TE
- 5-stage pipeline
- Single-cycle 32x16 multiplier
- Caches and TCMs
- Memory management unit (MMU)
- 2 AHB memory interfaces
- Jazelle technology

ARM1176JZ(F)-S Processor Core

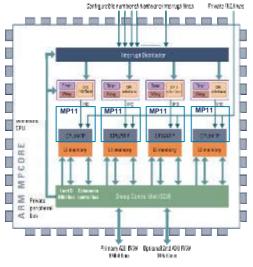

- TrustZone
- 8-stage pipeline
- Branch prediction
- Four AXI memory ports
- IEM (Intelligent Energy Management)
- Integrated VFP coprocessor

THE ARCHITECTURE FOR THE DIGITAL WORLD

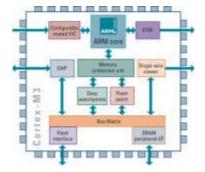

ARM

ARM11 MPCore Processor

- 1 4 MP11 processors
- Cache coherency
- Distributed interrupt controller

ARM Cortex-M3 Processor

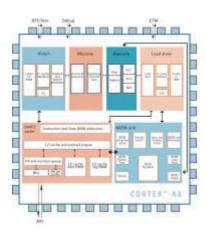

- Architecture v7-M (Thumb-2 only) → Very different from previous ARM processors
 - No CPSR register
 - Vector table contains addresses, not instructions
 - Processor automatically saves/restores state in exceptions
 - Only 2 processor modes (Thread/Handler)
 - No Coprocessor 15 3-stage pipeline with static branch prediction
- Atypical Implementation
 - Fixed memory map
 - Integrated interrupt controller
 - Serial-Wire Debug

THE ARCHITECTURE FOR THE DIGITAL WORLD

ARM

ARM Cortex-A8 Processor

- Architecture v7-A
- 14 stage pipeline
- NEON media processor

The Instruction Pipeline

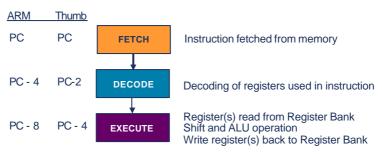

THE ARCHITECTURE FOR THE DIGITAL WORLD!

A

The Instruction Pipeline

- The ARM7TDMI uses a 3-stage pipeline in order to increase the speed of the flow of instructions to the processor
 - Allows several operations to be performed simultaneously, rather than serially

- The PC points to the instruction being fetched, not executed
 - Debug tools will hide this from you
 - This is now part of the ARM Architecture and applies to all processors

Optimal Pipelining

Cycle		1	2	3	4	5	6	7	8	9
Operation										
ADD F	D	Ε								
SUB	F	D	Ε							
ORR		F	D	Ε						
AND			F	D	Ε					
ORR				F	D	Ε				
EOR					F	D	Ε			

F - Fetch D - Decode E - Execute

- All operations here are on registers (single cycle execution)
- In this example it takes 6 clock cycles to execute 6 instructions
- Clock cycles per Instruction (CPI) = 1

HE ARCHITECTURE FOR THE DIGITAL WORLDS

ARM

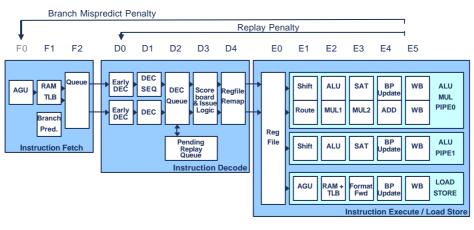

Branch Pipeline Example

Cycle				1	2	3	4	5	6	7	8	9
Address	Operation											
0x8000	BL 0x8FEC	F	D	Ε	EL	EA						
0x8004	SUB		F	D								
0x8008	ORR			F					Ī	Ī		
0x8FEC	AND				F	D	Ε		I			
	ORR					F	D	Е				
0x8FF4	EOR						F	D	Ε			

F - Fetch D - Decode E - Execute L - Linkret A - Adjust

- Breaking the pipeline
- Note that the core is executing in ARM state

Cortex-A8 Integer Pipeline

- Optimising code to make use of the processor pipeline is very difficult
- Leave it to the compiler!!

Reference Slides

Reference Material

- ARM ARM ("Architecture Reference Manual")
 - ARM DDI 0100E covers v5TE DSP extensions
 - Can be purchased from booksellers ISBN 0-201-737191 (Addison-Wesley)
 - Available for download from ARM's website
 - ARM v7-M ARM available for download from ARM's website
 - Contact ARM if you need a different version (v6, v7-AR, etc.)
- Steve Furber "ARM system-on-chip architecture" 2nd edition
 - ISBN 0-201-67519-6 (Addison-Wesley)
- Sloss, Symes & Wright "ARM System Developer's Guide"
 - ISBN: 1-55860-874-5 (Morgan Kaufman)
- RVCT Assembler Guide
 - Available for download from ARM's website
- Technical Reference Manuals for processor core being used
 - Available for download from ARM's website

THE ARCHITECTURE FOR THE DIGITAL WORLDS

ARM

Naming Conventions

- ARMx1z (e.g. ARM710T) indicates cache & full MMU
- ARMx2z (e.g. ARM720T) indicates cache, MMU & Process ID support
- ARMx3z (e.g. ARM1136J-S) indicates physically mapped caches and MMU
- ARMx4z (e.g. ARM740T) indicates cache and MPU
- ARMx5z (e.g. ARM1156T2-S) indicates cache, MPU and error correcting memory
- ARMx6z (e.g. ARM966E-S) indicates write buffer but no caches
- ARMx7z (e.g. ARM1176JZ-S) indicates AXI bus, & physically mapped caches and MMU
- ARMxy6 (e.g. ARM946E-S) indicates TCMs

Which architecture is my processor?

Processor core	Architecture
ARM7TDMI familyARM720T, ARM740T	v4T
 ARM9TDMI family 	v4T
 ARM920T,ARM922T,ARM940T 	WETE WETE I
 ARM9E family ARM946E-S, ARM966E-S, ARM926EJ-S 	v5TE, v5TEJ
 ARM10E family ARM1020E, ARM1022E, ARM1026EJ-S 	v5TE, v5TEJ
 ARM11 family 	v6
ARM1136J(F)-S	v6
ARM1156T2(F)-S	v6T2
 ARM1176JZ(F)-S 	v6Z
 ARM11 MPCore 	v6
Cortex family	
 ARM Cortex -A8 	v7-A
ARM Cortex -R4(F)	v7-R
 ARM Cortex -M3 	v7-M
 ARM Cortex -M1 	v6-M

For ARM processor naming conventions and features, please see the Appendix

THE ARCHITECTURE FOR THE DIGITAL WORLD

ARM

TrustZone Computing

- TrustZone adds a "parallel world" to allow trusted programs and data to be safely separated from the OS and applications
- Introduced for ARM1176, standard for ARMv7-A Cores
- Features:
 - New Secure Monitor Mode: gate-keeper for secure state
 - New S-bit in CP15 to indicate when the processor is running in a secured state
 - Security state exposed on external bus accesses to permit securityaware memory and peripherals
 - Ability to restrict debug to nonsecure state

NEON Media Processor Features

- Single Instruction Multiple Data (SIMD) Media Processor
- Targets audio and video codecs, image and speech processing, graphics, baseband processing, and general signal processing
- 3 Processing pipelines: Integer/fixed point, single precision floating point, IEEE vector floating point
- Efficient data handling
 - Best use of available memory bandwidth
 - Eliminates data arrangement overhead
 - Operates on separate register file
 - SIMD Framework excellent target for compilers
